PD08 • EXECUTIVE POWER BI DASHBOARD • MONTHLY FINANCIAL MONITORING & BUSINESS PERFORMANCE ANALYSIS

Financial Performance Executive Dashboard

Power BI Project Memo | The Finance Group

Prepared for: The Finance Group • **Tool:** Microsoft Power BI • **Data granularity:** Monthly

A. EXECUTIVE SUMMARY

This memo documents a monthly-level, interactive Power BI dashboard built for The Finance Group to monitor the company's financial health and key performance indicators (KPIs). The dashboard lets users analyze financial performance over time and filter results by date range, region, and product/service. It brings Profit & Loss, Cash Flow, Sales, Receivables and Payables Aging, and Budget vs. Actuals data into a single report, so management can review performance, compare results with budget, and follow up on cash flow and receivables from one place.

B. KPI SNAPSHOT

TOTAL REVENUE	GROSS MARGIN %	EBITDA %	NET CASH
24M	45.5%	24.8%	688K
Sum of Revenue	Gross Profit ÷ Revenue × 100	EBITDA ÷ Revenue × 100	Cash Inflows − Cash Outflows

Values reflect the current dashboard view. The currency has not been confirmed, so no currency symbol is shown.

C. ANALYTICAL APPROACH AND DASHBOARD FEATURES

The report is built on monthly data: the **Month** field is a Date data type representing monthly periods, not daily transaction-level records. Five visuals support the analysis:

- **Revenue & Gross Profit Trend –** compares monthly Revenue and Gross Profit.
- **Revenue vs Budget & Variance % –** compares monthly Revenue against Revenue Budget and displays Budget Variance %.
- **Total Revenue by Product/Service –** compares revenue contribution across products and services.
- **Receivables Aging (Days) by Region –** compares average receivables aging days across regions.
- **Cash Flow Waterfall –** shows Cash Inflows, Cash Outflows, and the resulting net cash total.

Calculation logic. Total Revenue = Sum of Revenue. Gross Margin % = Gross Profit ÷ Revenue × 100. EBITDA % = EBITDA ÷ Revenue × 100. Net Cash = Cash Inflows − Cash Outflows. Budget Variance % = (Revenue − Revenue Budget) ÷ Revenue Budget × 100. Receivables Aging = Average Receivables Aging Days, analyzed by Region. In Power BI, the Budget Variance measure returns the ratio (Revenue − Revenue Budget) ÷ Revenue Budget and is formatted as a percentage, so it is not multiplied by 100 again in DAX; the × 100 above only illustrates the conversion from ratio to percentage.

Interactivity. Users can filter by Month, Quarter, and Year; choose a start and end date with the date-range slicer; and filter by Region and Product/Service. Drill-down moves from monthly analysis to Product/Service-level detail. The date-range slicer was tested: the KPI cards and visuals update when the selected date range changes.

D. KEY FINDINGS

The following are observations from the current dashboard view:

- **Revenue by month:** November is the highest revenue month and October the lowest.
- **Product/Service:** Product C and Service X are the leading entries.
- **Region by revenue:** North is the top region by revenue.
- **Receivables:** South has the highest average receivables aging.

These are observations only, not universal conclusions, and no causes are inferred. They help management identify periods for closer performance review, compare product/service contribution, assess regional performance, and investigate receivables collection delays.

E. DATA QUALITY, ASSUMPTIONS AND LIMITATIONS

- **Monthly granularity:** the dashboard is monthly-level and should not be used for daily transaction analysis.
- **Calculation basis:** Budget Variance % is calculated from Revenue and Revenue Budget; Receivables Aging is shown as average aging days by region.
- **Rounding:** the Net Cash KPI is 688K, while the Waterfall total is displayed as approximately 0.7M due to rounding. Exact reconciliation should be validated against the underlying source values if it has not already been confirmed.
- **Data-quality validation:** the source data should be checked for missing values, invalid values, and calculation inconsistencies. This memo does not claim that any issues were found or resolved; validation and documentation are required before final submission.

F. CONCLUSION

The dashboard gives The Finance Group a single, filterable monthly view for financial performance monitoring, budget comparison, product/service evaluation, regional analysis, and cash-flow review. Subject to the validation noted above, it supports routine management review and complements the Power BI (.pbix) file by documenting its logic, findings, assumptions, and functionality.
